

M 7.6 Hojancha, Costa Rica Earthquake of 5 September 2012

PAGER

USGS Earthquake Shaking Yellow Alert

USAID ANSS-44 PAGER Version 3

M 7.6, COSTA RICA
Origin Time: Wed 2012-09-05 14:42:10 UTC (08:42:10 local)
Location: 10.12°N, 85.34°W Depth: 40.8 km
FOR TSUNAMI INFORMATION, SEE: tsunami.noaa.gov

Estimated Fatalities Yellow alert for shaking-related fatalities and economic losses. Some casualties and damage are possible and the impact should be relatively localized. Past yellow alerts have required a local or regional level response.

Estimated Economic Losses Estimated economic losses are less than 1% of GDP of Costa Rica.

Estimated Population Exposed to Earthquake Shaking

ESTIMATED POPULATION EXPOSED TO SHAKING	I	II-III	IV	V	VI	VII	VIII	IX	X
ESTIMATED POPULATION	0	0	0	0	0	0	0	0	0
ESTIMATED MODERITY	I	II-III	IV	V	VI	VII	VIII	IX	X
PERCEIVED SHAKING	Not felt	Weak	Light	Moderate	Strong	Very Strong	Severe	Violent	Extreme
POTENTIAL DAMAGE	None	None	None	Light	Moderate	Moderately Heavy	Heavy	Very Heavy	Very Heavy
POTENTIAL COLLAPSE	None	None	None	Light	Moderate	Moderately Heavy	Heavy	Very Heavy	Very Heavy

Population Exposure

Overall, the population in this region resides in structures that are vulnerable to earthquake shaking, though some resistant structures exist. The predominant vulnerable building types are adobe block and mud wall construction.

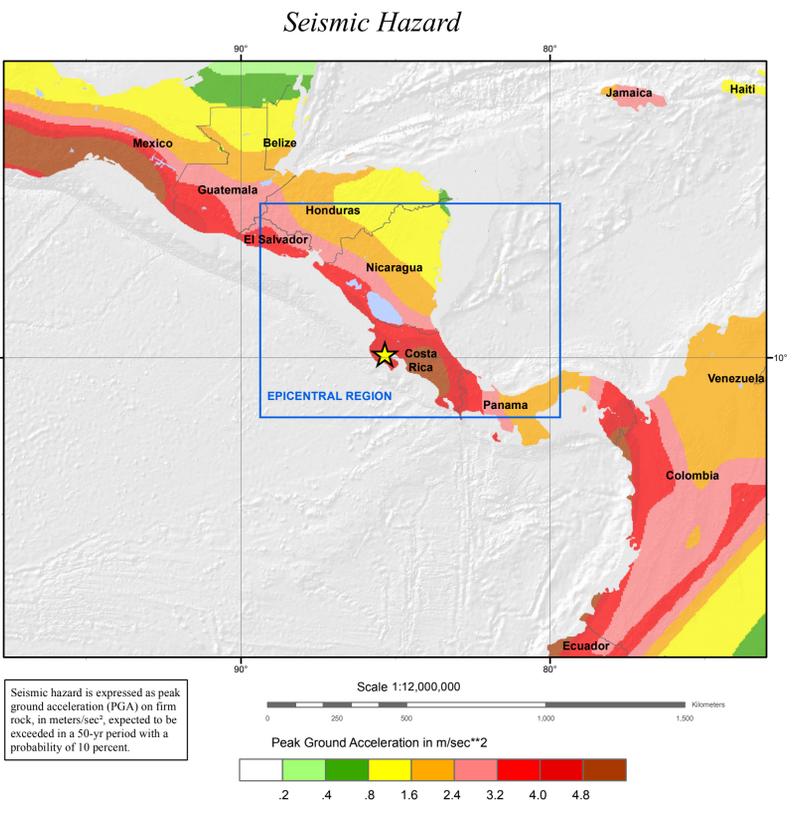

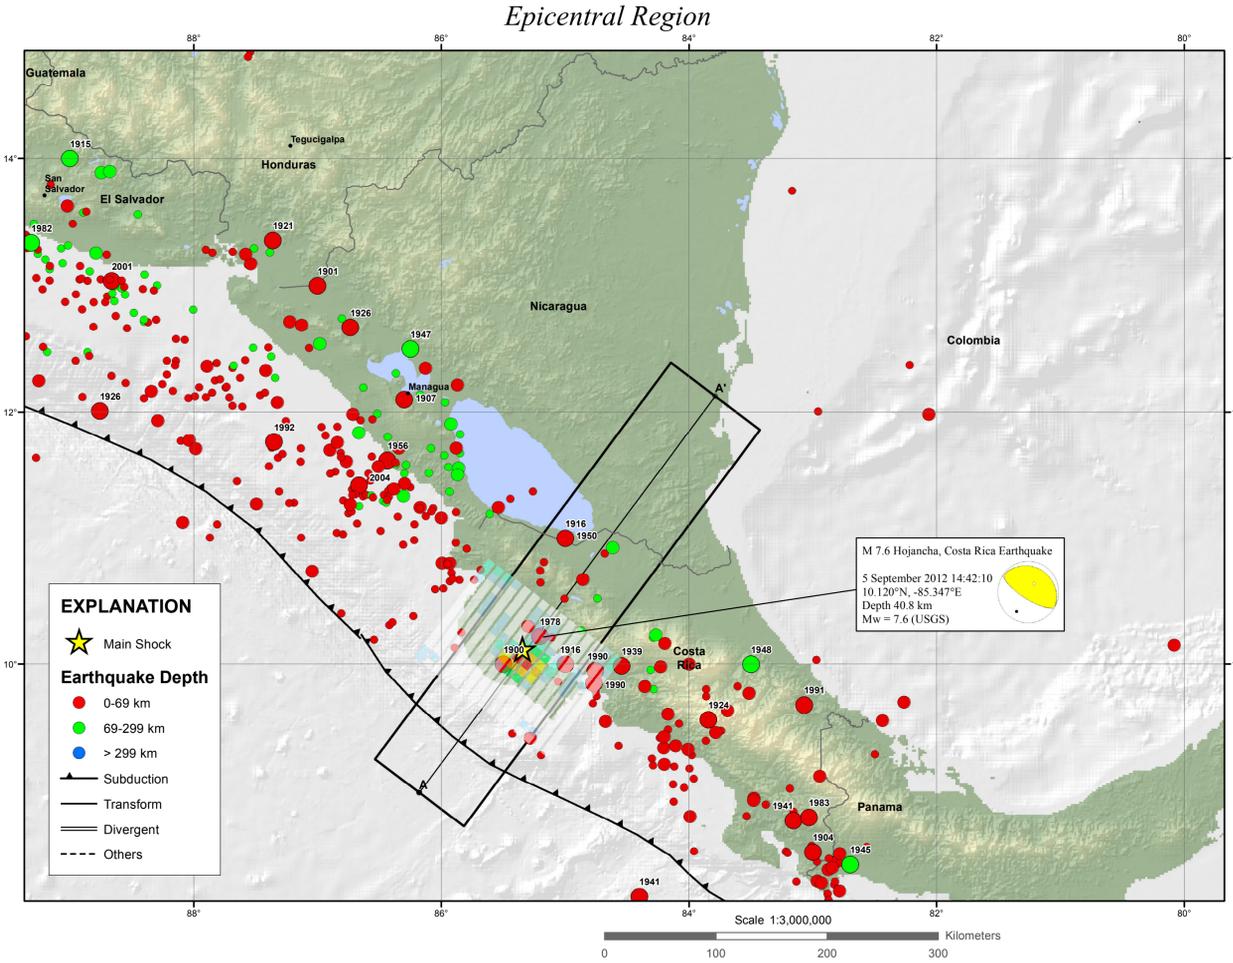

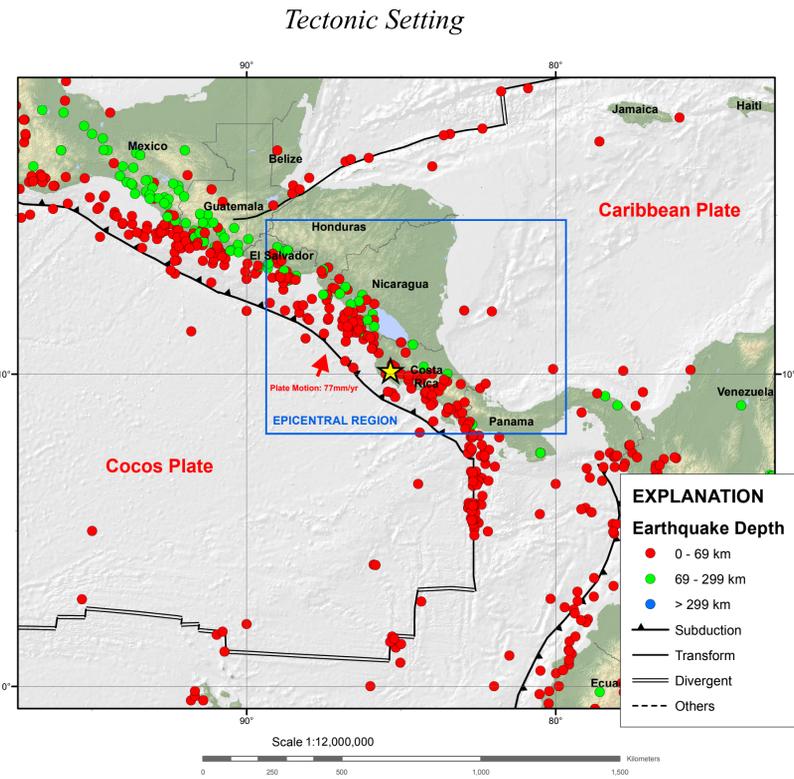

Historical Earthquakes (with MMI levels):

Date (UTC)	Dist. (km)	Max Shaking (MMI)	Deaths
2002-02-20	183	5.8	0
1963-07-10	183	5.8	0
1903-04-22	254	7.6	30

Selected City Exposure

MMI City	Population
VIII Santa Cruz	124
VII Nandayure	24
VII Nicoya	144
VII Hojancha	24
VII Samara	14
VII Panguera	24
V San Jose	3354
IV Managua	9734
IV Masaya	1234
IV Leon	1454
III David	834

Event ID: us000cfd

TECTONIC SUMMARY

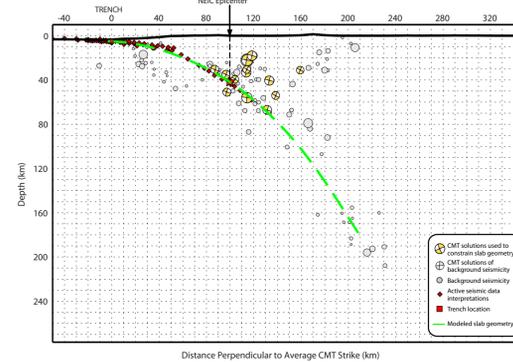

The September 5th 2012 M 7.6 earthquake beneath the Nicoya Peninsula, Costa Rica, occurred as the result of thrust faulting on or near the subduction zone interface between the Cocos and Caribbean plates. At the latitude of this earthquake, the Cocos plate moves north-northeast with respect to the Caribbean plate at a velocity of approximately 77 mm/yr, and subducts beneath Central America at the Middle America Trench.

Over the past 40 years, the region within 250 km of the September 5th earthquake has experienced approximately 30 earthquakes with M 6 or greater; two of these were larger than M 7, and neither caused documented fatalities. The first was a M 7.2 in August of 1978, 9 km to the north-northeast of the September 5th event; the second had a magnitude of M 7.3, and struck a region just over 50 km to the east-southeast in March 1990. The earthquake of October 5, 1950, M 7.8, occurred in the general area of the September 5th 2012 earthquake, although the hypocenter of the earlier earthquake is not known to high precision. The 1950 earthquake caused damage in northwestern Costa Rica and in the Valle Central of Costa Rica, but no reported casualties. The closest earthquake to cause fatalities in recent history was the M 6.5 April 1973 earthquake, which occurred at shallow depth approximately 80 km to the northeast; the 1973 shock resulted in 26 fatalities and over 100 injuries.

DISCLAIMER

Base map data, such as place names and political boundaries, are the best available but may not be current or may contain inaccuracies and therefore should not be regarded as having official significance.

Finite Fault Model

Distribution of the amplitude and direction of slip for subfault elements of the fault rupture model are determined from the inversion of teleseismic body waveforms and long period surface waves. Arrows indicate the amplitude and direction of slip (of the hanging wall with respect to the foot wall); the slip is also colored by magnitude. The view of the rupture plane is from above. The strike of the fault rupture plane is N37°E and the dip is 25°NE. The dimensions of the subfault elements are 10km in the strike direction and 8 km in the dip direction. The rupture surface is 70 km along strike and 50 km downdip. The seismic moment release based upon this plane is 2.93e+27 dyne.cm.
