Quaternary Fault and Fold Database of the United States

As of January 12, 2017, the USGS maintains a limited number of metadata fields that characterize the Quaternary faults and folds of the United States. For the most up-to-date information, please refer to the <u>interactive fault map</u>.

Gallina fault (Class A) No. 2001

Last Review Date: 2015-12-11

Compiled in cooperation with the New Mexico Bureau of Geology & Mineral Resources

citation for this record: Kelson, K.I., and Jochems, A.P., compilers, 2015, Fault number 2001, Gallina fault, in Quaternary fault and fold database of the United States: U.S. Geological Survey website, https://earthquakes.usgs.gov/hazards/qfaults, accessed 12/14/2020 02:23 PM.

Synopsis	The Gallina fault, which forms the western margin of the Gallina- Archuleta arch, is a high-angle to nearly vertical normal fault (Baltz, 1967 #1167; Woodward, 1987 #1130; Woodward and others, 1992 #7628). There is no documented geologic evidence for Quaternary activity along the Gallina fault, although the spatial coincidence of diffuse contemporary microseismicity within the Gallina-Archuleta arch suggests that the Gallina fault may be active (Wong and others, 1995 #1155; House and Hartse, 1995 #1160).
Name comments	The Gallina fault is along the northern extension of the Nacimiento fault [2002] (Manley and others, 1987 #1119;

County(s) and State(s)RIO ARRIBA COUNTY, NEW MEXICOPhysiographic province(s)COLORADO PLATEAUSReliability of locationGood Compiled at 1:24,000 scale.Comments: Original fault location based on map compilation at a scale of 1:250,000 by Manley and others (1987 #1119); location improved by more detailed (1:24,000) geologic maps addressing some of the fault (Woodward and others, 1976 #7290; Crouse and others, 1992 #7289) combined with accurate placement using photogrammetric methods.Geologic setting Length (km)The Gallina-Archuleta arch separates the Chama Basin and the San Juan Basin (Baltz, 1967 #1167; Woodward, 1987 #1130). The arch formed during Laramide deformation and likely was reactivated during Miocene formation of the Rio Grander ift (Woodward, 1987 #1130). Wong and others (1995 #1155) and House and Hartse (1995 #1160) noted that the Gallina-Archuleta arch is spatially coincident with contemporary seismicity, which may represent late Quaternary reactivation of the Laramide structure.Length (km) movement39 km.Average strike movementNormal Comments: Manley and others (1987 #1119) and Woodward (1987 #1130) show the fault as a high-angle normal fault. Crouse and others (1992 #7628) mapped right-lateral slip in the French Mesa quadrangle apparently based on the juxtaposition of Triassic and Jurassic strata.		Woodward, 1987 #1130) and extends from the northern end of the Sierra Nacimiento, 7 km northeast of Regina, to about 5 km south of El Vado Reservoir. Woodward and others (1992 #7628) used the name "Tierra Montañosa fault" for the northern 10 km, but the name "Gallina fault" has subsequently been applied to its entire trace (House and Hartse, 1995 #1160).

Crouse and others (1992 #7628) mapped right-lateral slip in the French Mesa quadrangle apparently based on the juxtaposition of Triassic and Jurassic strata.
	Dip Direction	E; W

	<i>Comments:</i> There are no deep structural data published for the Gallina fault. Manley and others (1987 #1119) map a linear fault trace across rugged topography, suggesting high-angle fault strands. The southern 20 km of the fault dips to the west (Woodward and others, 1992 #7628).
Paleoseismology studies	
Geomorphic expression	The southern part of the fault lies along the west-facing western margin of Capulin Mesa. If there is an absence of Quaternary activity, the escarpment along the mesa margin likely is related to differential erosion of less resistant rocks on the western side of the fault.
Age of faulted surficial deposits	Youngest faulted bedrock is Cretaceous in age, but there are no Tertiary units mapped across the fault (Manley and others, 1987 #1119). There are little or no data on the presence or absence of displaced late Quaternary deposits. At the southern end of the fault, Manley and others (1987 #1119) mapped undisplaced gravel across the fault trace at Rio Capulin, but the gravel is considered to be of undifferentiated Quaternary age.
Historic earthquake	
Most recent prehistoric deformation	undifferentiated Quaternary (<1.6 Ma) <i>Comments:</i> Timing of the most-recent event is unknown. Possible association with contemporary microseismicity suggests late Quaternary activity (Wong and others, 1995 #1155; House and Hartse, 1995 #1160).
Recurrence interval	
Slip-rate category	Less than 0.2 mm/yr <i>Comments:</i> Low slip-rate category assigned based on lack of documented late Quaternary displacement.
