

# Quaternary Fault and Fold Database of the United States

As of January 12, 2017, the USGS maintains a limited number of metadata fields that characterize the Quaternary faults and folds of the United States. For the most up-to-date information, please refer to the [interactive fault map](#).

## Dugout Wells fault (Class A) No. 923

Last Review Date: 1995-10-17

### Compiled in cooperation with the Texas Bureau of Economic Geology

*citation for this record:* Collins, E., compiler, 1995, Fault number 923, Dugout Wells fault, in Quaternary fault and fold database of the United States: U.S. Geological Survey website, <https://earthquakes.usgs.gov/hazards/qfaults>, accessed 12/14/2020 03:13 PM.

<b>Synopsis</b>	Fault is on western side of the Tornillo Graben. The faulted deposits are only briefly described as being Quaternary in age and having a low scarp. Detailed observations and measurements of scarp morphology have not been made, nor has the fault been confirmed by field studies.
<b>Name comments</b>	Named by Stevens (1994 #914). Fault extends from about 2.5 km northeast of Panther Junction to about 0.75 km east of Dugout Wells, Big Bend National Park.
<b>County(s) and State(s)</b>	BREWSTER COUNTY, TEXAS
<b>Physiographic</b>	BASIN AND RANGE

<b>province(s)</b>	BASIN AND RANGE
<b>Reliability of location</b>	Poor Compiled at 1:250,000 scale.  <i>Comments:</i> Location based on 1:250,000-scale map compiled from 1:65,000-scale aerial photographs by E.W. Collins in 1995 and brief description of Stevens (1994 #914) and P.W. Dickerson (oral commun., 1995).
<b>Geologic setting</b>	This down-to-northeast fault is on the western side of the Tornillo Graben. It may be the same fault that Henry and others (1985 #866) mapped, although they did not find evidence of Quaternary surface rupture.
<b>Length (km)</b>	3 km.
<b>Average strike</b>	N16°W
<b>Sense of movement</b>	Normal  <i>Comments:</i> Not studied in detail; sense of movement inferred from topography. Some Cenozoic faults in the Big Bend region exhibit oblique and horizontal slip, thus detailed investigations of the Dugout Wells fault are required to determine the actual sense of movement.
<b>Dip Direction</b>	NE
<b>Paleoseismology studies</b>	
<b>Geomorphic expression</b>	Stevens (1994 #914) recognized a low scarp but did not report its heights or slope angles.
<b>Age of faulted surficial deposits</b>	Quaternary. Stevens (1994 #914) reported Quaternary deposits as faulted but did not describe the fault or faulted deposits in detail.
<b>Historic earthquake</b>	
<b>Most recent prehistoric deformation</b>	undifferentiated Quaternary (<1.6 Ma)  <i>Comments:</i> Based on Stevens (1994 #914).
<b>Recurrence</b>	

<b>interval</b>	
<b>Slip-rate category</b>	Less than 0.2 mm/yr  <i>Comments:</i> Inferred low slip rate based on general knowledge of slip rate estimates for other faults in the region.
<b>Date and Compiler(s)</b>	1995 E.W. Collins, Bureau of Economic Geology, The University of Texas at Austin
