

***The Mount Rainier Lahar Detection
System, 1998-present***

Seth Moran, Wes Thelen, Rebecca Kramer, Ben Pauk, Alex Iezzi

Rainier Volcano Hazards:

- ~40 eruptions in last 10,000 years.
- Most recent eruption ~1,000 years ago; largest ash-producing eruption ~2,200 years ago
- At least 9 large lahars in last 5,600 years have reached now-densely populated areas.
- Most recent large lahar: ~1500 A.D. (Electron Mudflow)
- Most large lahars associated with eruptions; Electron was not.
- >90,000 people live in Rainier lahar hazard zones

Rainier Lahar Hazards

- Osceola Lahar
- National Lahar
- Electron Lahar

Revised August, 2012

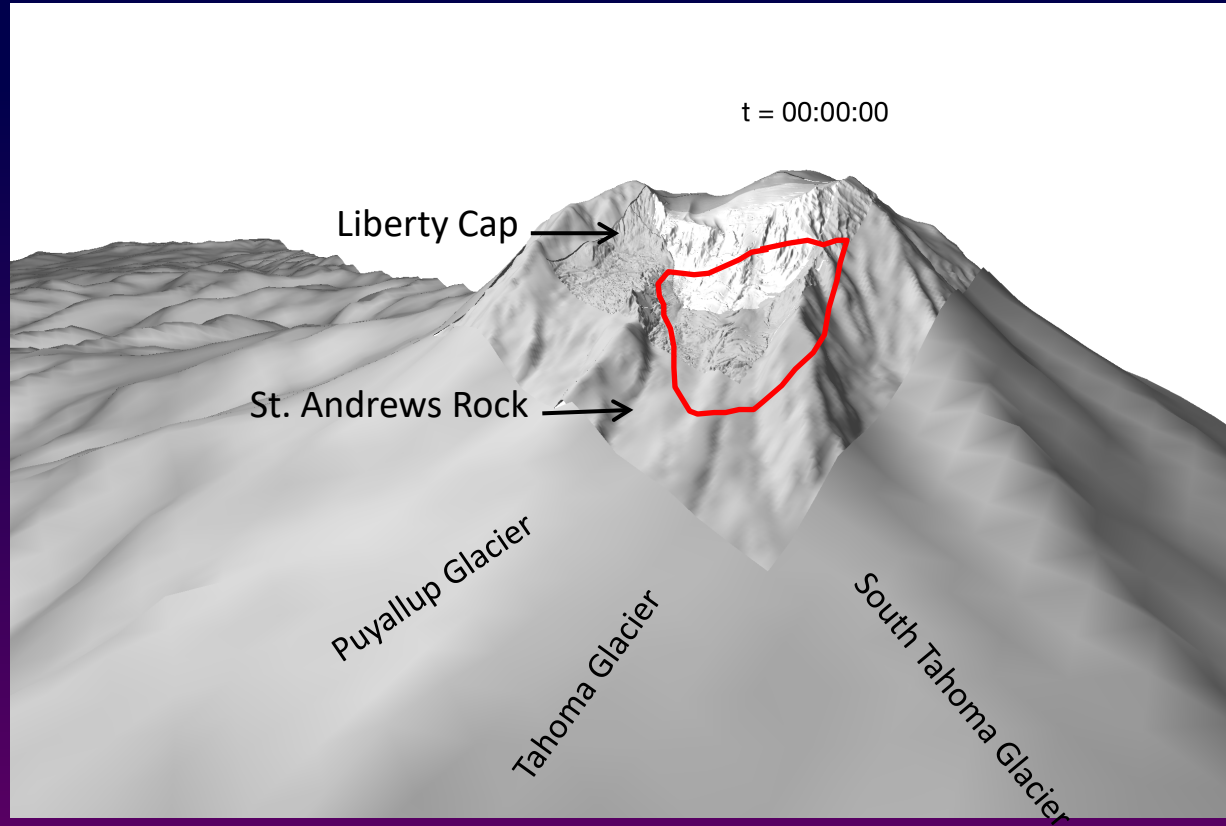

Rainier Lahar Hazards

Reid et al. (2001), Finn et al (2001) – area of instability on west flank

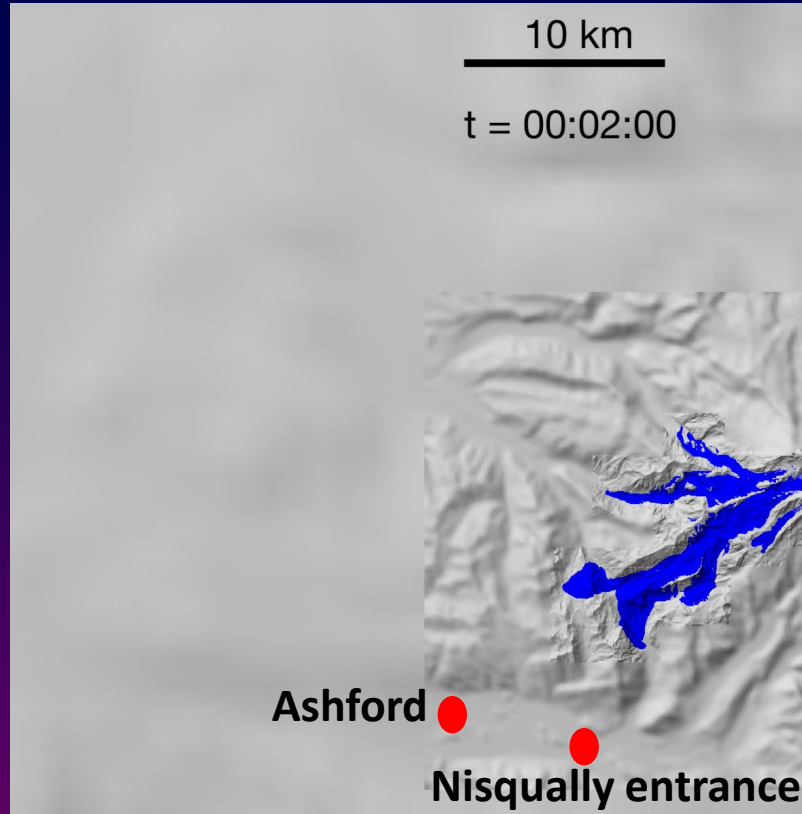

Rainier Lahar Hazards

D-Claw Model:
Uses 260 M m³
debris avalanche in
least- stable source
region

Rainier Lahar Hazards

Rainier Lahar Hazards

t = 10 minutes

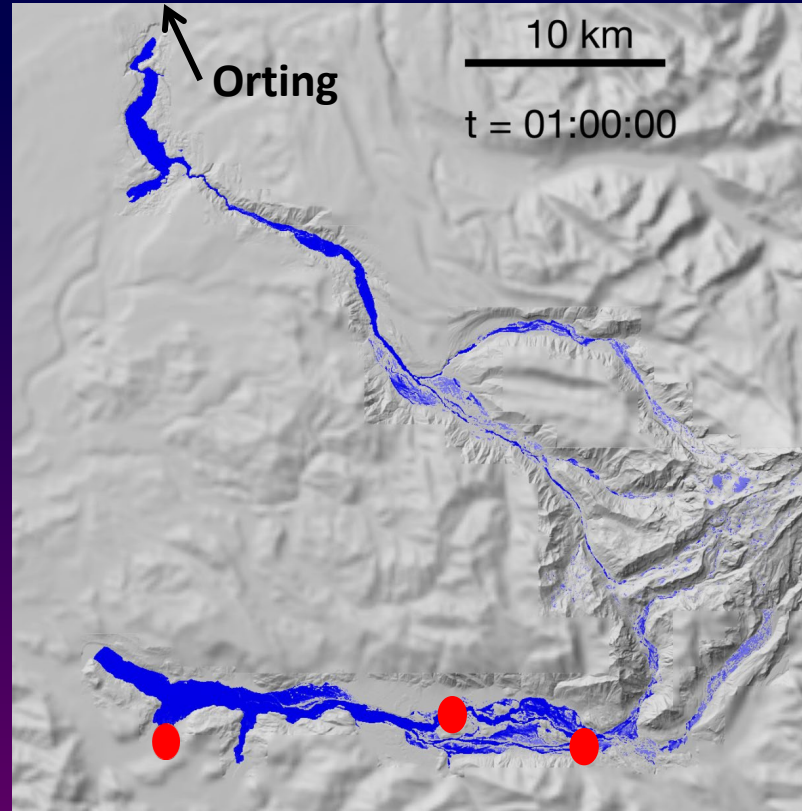

Rainier Lahar Hazards

t = 20 minutes

Rainier Lahar Hazards

t = 60 minutes

Rainier Lahar Detection System v 1.0: 1998

1998 system:

- Separate detection & alarm components
- USGS designs & installs detection component:
 - 6 AFM stations & several tripwires in Puyallup & Carbon Rivers.
 - Detection software runs on computers at WA EMD and South Sound 911 24/7 EOCs
 - Pierce County responsible for M&O
- Alarm component operated by 24/7 EOCs at WA EMD & South Sound 911
 - Requires SOPs, training, rigorous testing, & periodic M&O by USGS, WA EMD, and/or South Sound 911 IT staff.

Rainier Lahar Detection System v 1.0: 1998

Rainier Lahar Detection System v 1.0: 1998

- Red = 40 million m³
- Pink = 250 million m³
- Yellow dots = AFM/tripwire station locations.

Rainier Lahar Detection System v 1.0: 1998

Challenges w/ 1998 system:

- No real-time seismic data (only 2-min RSAM)
 - > 2-minute delay in alert
 - USGS receives Congressional funding for upgrading RLDS in 2017 & has received annual appropriations through FY23
- Only trip
- Didn't have coverage for Tanoma Creek (lahar hazard)
- Not integrated with Rainier volcano monitoring network
- No dedicated \$\$ for M&O (performed by Pierce County)

Rainier Lahar Detection System: 2017-present

Goals for new system:

- **Real-time data transmission**
- **Use broadband seismometers & add other sensors (infrasound, webcams) for new detection capabilities**
- **Install new stations closer to volcano to improve warning time, particularly along Tahoma Creek.**
- **Integrate RLDS with existing volcano monitoring network.**
- **USGS performs M&O**
- **One thing unchanged from 1998: USGS does the detection, WA EMD/Pierce County/South Sound 911 do the warning.**

Rainier Lahar Detection System: 2025

Lahar Detection Network (volcano network + new lahar stations):

- # of instrument types:
 - 40 broadbands
 - 7 GPS
 - 30 infrasound sites
 - ~5-6 webcams (some operated by NPS)
 - ~10 telemetry repeaters
 - CVO responsible for M&O at ~45 sites
- Still has gaps!!!
 - Does not adequately cover all lahar-prone drainages (would be primary focus w/ unrest).
